

IBITIcoin (IBITI) — Whitepaper

Version 2.0 • November 2026
Network: BNB Smart Chain (BEP-20, chainId 56)

This document describes IBITIcoin as it is implemented on-chain: a fixed-supply token on BNB Smart Chain and a set of separate utility contracts. The token, team vesting, the website sale, staking and the NFT collection are live. It is not a marketing brochure; the goal is to reflect the real architecture and operational model.

Contract source code is publicly available in the IBITIcoin GitHub repository. Where this document and the code differ, the code and on-chain state are the source of truth.

Nothing in this document constitutes financial, legal or tax advice. IBITIcoin is an experimental project. Participants should do their own research and never allocate funds they cannot afford to lose.

1. Vision & Motivation

Most small-cap tokens live in a split reality. On-chain, there is a simple ERC-20 contract. Off-chain, there are spreadsheets, promises, screenshots and private deals. Once the cycle turns, nothing of that off-chain structure is enforceable.

IBITIcoin is built as a "contract-first" project: if something affects fees, rewards or liquidity, it should be encoded in transparent smart contracts, not only in social media posts. The system is built out of independent modules instead of a single monolithic contract.

The long-term vision is to turn IBITIcoin into a base asset for a small but serious ecosystem: tools for trading and holding, staking and an NFT collection, all of which anyone can audit at any time.

2. Token definition & supply

Core parameters

- Name: IBITIcoin
- Symbol: IBITI
- Standard: BEP-20 (compatible with ERC-20)
- Network: BNB Smart Chain (BSC, chainId 56)
- Decimals: 8
- Total supply: 100,000,000 IBITI, fixed at deployment
- Token contract (BscScan): `0x71b552D3503fe20610aaA470A96E1838fae8381A`

2.1 Supply model

The full supply was created once, in the token's constructor, and sent straight to its recipients. There is no mint function, no owner and no reserve inside the token contract. Supply can only go down, through burning.

2.2 Allocation

Share	IBITI	Held by
Liquidity, exchanges, listings	70,000,000	Liquidity wallet `0xC00dC8E3F4647AAa4791AE58901eDDFE6095adA5`
Marketing and reserve	19,999,895.9835292	Reserve wallet `0x9d8dd8B2CFF7A17967fA0eF19eD5C0b3EBeFDe41`
Team vesting	10,000,000	Vesting contract `0xC4bdF5b6d7688a7d5457A194ac1210ec34003604`
Holders of the previous token version	104.0164708	4 addresses, listed in the project repository
Total	**100,000,000**	

The liquidity wallet is added to the PancakeSwap pool and exchanges gradually. The reserve wallet funds marketing, ecosystem needs and, staking rewards. 1,000,000 IBITI each went from it to the website sale and to the staking reward pool by plain transfers.

3. Smart-contract architecture

Each contract focuses on a narrow area. Modules know the token; the token knows nothing about them. This keeps the token minimal, and any module can be fixed or replaced by a new deployment while the token stays the same. Contracts are built on OpenZeppelin Contracts 4.9.3 and compiled with solc 0.8.22. No live contract is behind a proxy.

3.1 Live contracts

IBITI.sol
Standard ERC-20 with burn. It has no owner, minting, pause, fees, blacklist or upgrade path.

IBITIVesting.sol
Holds the team share on one fixed schedule. See section 4.

IBITIPromoSale.sol
Website sale of IBITI for USDT at a fixed price, with a bonus and a referral reward. See section 5.

IBITIStaking.sol
Lock IBITI for a fixed period for known rewards. See section 7.

IBITICollection.sol
The NFT collection: 11 cards with no expiry and no burning. See section 8.

IBITINFTSale.sol
Sale of the cards for USDT. See section 8.

3.2 Deferred modules (not deployed)

BuybackManager.sol
Deferred. If used later, it would acquire IBITI on the market and optionally burn it.

4. Team vesting

The team share of 10,000,000 IBITI sits in the vesting contract on one fixed schedule.

Milestone	Unlocked	IBITI	When (UTC)
Start	20%	2,000,000	1 Nov 2026
+ 180 days	+30%	3,000,000	30 Apr 2027
After 1095 days	+ up to 50%, linear over 180 days	up to 5,000,000	From 31 Oct 2029
Fully unlocked	100%	10,000,000	29 Apr 2030

- Only the owner can pay out, only to addresses the owner has listed, and only what the schedule has unlocked.
- The token, the allocation and the schedule are fixed in the contract and cannot be changed.
- Ownership cannot be renounced, and transferring it takes two steps.

5. Website sale

Website purchases are executed by a verified contract, `0x42924EE213eF1943BE655c2C535FB72F52C64781`, at a fixed price that does not depend on any pool.

Parameter	Value	Can it change?
Price	$0.11 per IBITI ($0.10 with the bonus)	By the owner, only while paused, between $0.001 and $10
Purchase limits	10 to 100 USDT	By the owner, only while paused
Bonus	10%	No
Referral reward	1 IBITI, once per buyer	No
USDT receiver	Reserve wallet	No

```
Buyer USDT    -- transferFrom --> Reserve wallet (directly, same transaction)
Sale contract -- transfer     --> Buyer: IBITI    (purchased amount + 10% bonus)
Sale contract -- transfer     --> Referrer: IBITI (1 IBITI, once per buyer)

purchased = USDT * 10^8 / price      example: 10 USDT = 100 IBITI + 10 bonus = 110 IBITI
```

- USDT is never stored on the sale contract.
- IBITI is paid only from the contract's own balance, funded with 1,000,000 IBITI by a plain transfer. A purchase that needs more reverts.
- The owner can stop the sale, and while it is paused can change the price and limits and withdraw unsold IBITI.
- The logic cannot be changed: a different rule means a new contract at a new address.

6. Fees

IBITI takes no fee. Transfers and PancakeSwap trades pay no IBITI fee, and the token has no way to charge one. On PancakeSwap you pay only the pool's own swap fee and gas. There is no sell contract and no fee contract on mainnet. If a paid product appears later, its terms will be published with its contract. A new contract cannot change the token.

7. Staking

Live on mainnet at `0x82BA8720FBa8a6A939D078b9ed62afB9ABC3B426`. Choose a term of 1 to 12 months (30 days each) and a stake of at least 100 IBITI. Rewards come from a pool on the staking contract, funded

by plain transfers with no wallet approvals. Your reward is reserved when you stake, so one user's stake never pays another user's reward. When the pool runs out, new stakes are refused and existing stakes are not affected.

Months	1	2	3	4	5	6	7	8	9	10	11	12
Reward on time / penalty if early, %	1	3	5	7	10	12	14	18	20	22	25	30

When you withdraw	**You receive**	**Example: 1,000 IBITI for 12 months**
Before the term ends	Stake minus penalty, no reward	700 IBITI
Within 30 days after the term	Stake and reward, or renew with a new amount and term	1,300 IBITI
Later	Stake only, with no time limit; the reward is lost	1,000 IBITI

A pause stops new stakes and renewals; withdrawing always stays open. Penalties and lost rewards stay in the pool, and the owner can withdraw its free part. Stakes and reserved rewards are out of the owner's reach.

8. NFT collection

The Path of Humanity is a collection of 11 cards from the story told in our book. Collection `0x37F535AF03966CEFa35Bd6fe1d481831d9bc3a67`, sale `0x44E65077168De8Ff5EC6545857DAd2cB02310fe2`. Any card can be bought at any time with USDT in the NFT Gallery on the website, and USDT goes straight to the reserve wallet.

- An NFT stays yours for good: no expiry, no burning. You can keep it or transfer it.
- Each card has its own edition, which can be lowered but never raised. The price of each card is set once in USDT and can never change, up or down, not even by the owner.
- The contract has no burn or pause: the owner cannot take, burn or freeze an NFT.
- Cards are issued only by the sale contract, at the card's price. That contract is set once and cannot be replaced. The collection can never hold more than 12 cards.
- A resale on a marketplace that honours it pays 5% to the reserve wallet; the owner can change this, up to 10%.
- It is a collectible: it gives no discount, no income and no share in the project.

Rarity	**Cards**
Normal	Creation
Rare	Awakening, The First Gods and Kings, Enlightenment
Legendary	The Age of Darkness and Faith, Blood and Steel, Digital Cell
Epic	The Last Frontier, Quantum Leap, End or Rebirth
Pandora	Pandora

The Full Collection. A separate collector's item: all 11 cards together with the book. The price will be announced later, and it is not on sale until then.

9. Liquidity & market structure

- Primary pair: IBITI / USDT on PancakeSwap V2.

- Pool address: `0x5b39C5A553a7355eb47368a9Af5ec5aDB5C7e9d3`. The pool is created when liquidity is added and opens at $0.10.
- Router: PancakeSwap V2 router at `0x10ED43C718714eb63d5aA57B78B54704E256024E`.
- Stablecoin: USDT on BSC at `0x55d398326f99059fF775485246999027B3197955`.

Liquidity is added gradually, as separate on-chain transactions. Each operation approves the exact amounts to the router and resets the allowances to zero afterwards, including when adding liquidity fails. No permanent approvals are left on project wallets.

The website price and the pool price are independent. The pool price moves with trading and can differ from the website price in either direction.

10. Security considerations

No smart contract can be considered perfectly safe. The following measures reduce risk, without pretending to eliminate it completely.

- Use of OpenZeppelin: core primitives such as ERC20, Ownable2Step, Pausable and ReentrancyGuard come from widely audited libraries.
- No proxies: live contracts cannot be upgraded. When a module is replaced, it happens through a new deployment at a new address.
- No admin in the token: nobody can mint, pause, freeze or take a fee. This also means nobody can recover stolen tokens.
- Separation of roles: the liquidity wallet, the reserve wallet and the vesting owner are separate hardware wallets.
- Limited allowances: routers and other external contracts get allowances per operation, reset to zero afterwards.
- Verified source code on BscScan, public code and tests on GitHub.
- No independent third-party audit has been completed yet.

Despite these measures, IBITIcoin remains an experimental project. Until the pool has liquidity, there is no open market to sell IBITI. Bugs, market events or external dependencies could lead to partial or total loss of funds. There is no implicit or explicit guarantee of capital protection.

11. Legal & regulatory note

IBITI does not represent equity, debt or any direct claim on a company or legal entity. It is a utility token designed for use inside the IBITIcoin ecosystem.

- No ICO/IEO: IBITI has not been sold via centralized ICO, IEO or launchpad. Distribution is performed through on-chain liquidity, the website sale, incentives and direct transfers.
- No guaranteed returns: holding IBITI does not entitle the holder to profits, dividends or any form of guaranteed return.
- Jurisdictional differences: regulation of digital assets differs between countries. Each participant is responsible for understanding and complying with local laws, including tax obligations.

12. How to buy IBITI (summary)

Always verify contract addresses manually from official sources.

- Configure your wallet (for example MetaMask, Trust Wallet) for BNB Smart Chain (BSC, chainId 56).
- Fund your wallet with a small amount of BNB for gas fees and some USDT (BEP-20).
- On the website: open https://www.ibiticoin.com, connect your wallet and buy for 10 to 100 USDT per purchase.

- On PancakeSwap, once the pool has liquidity: swap USDT for IBITI using the token address above, and pay attention to price impact and slippage.
